

COMPASS_Iron_Reacidification_Comparison_2026

Zoe Read

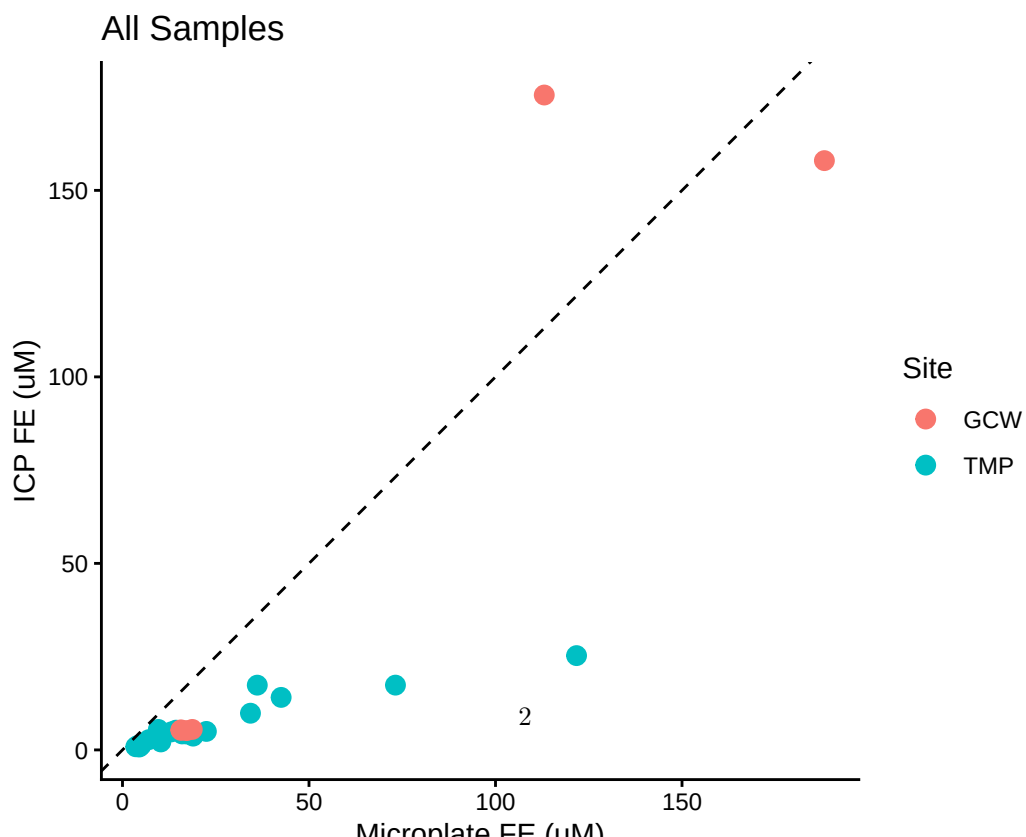

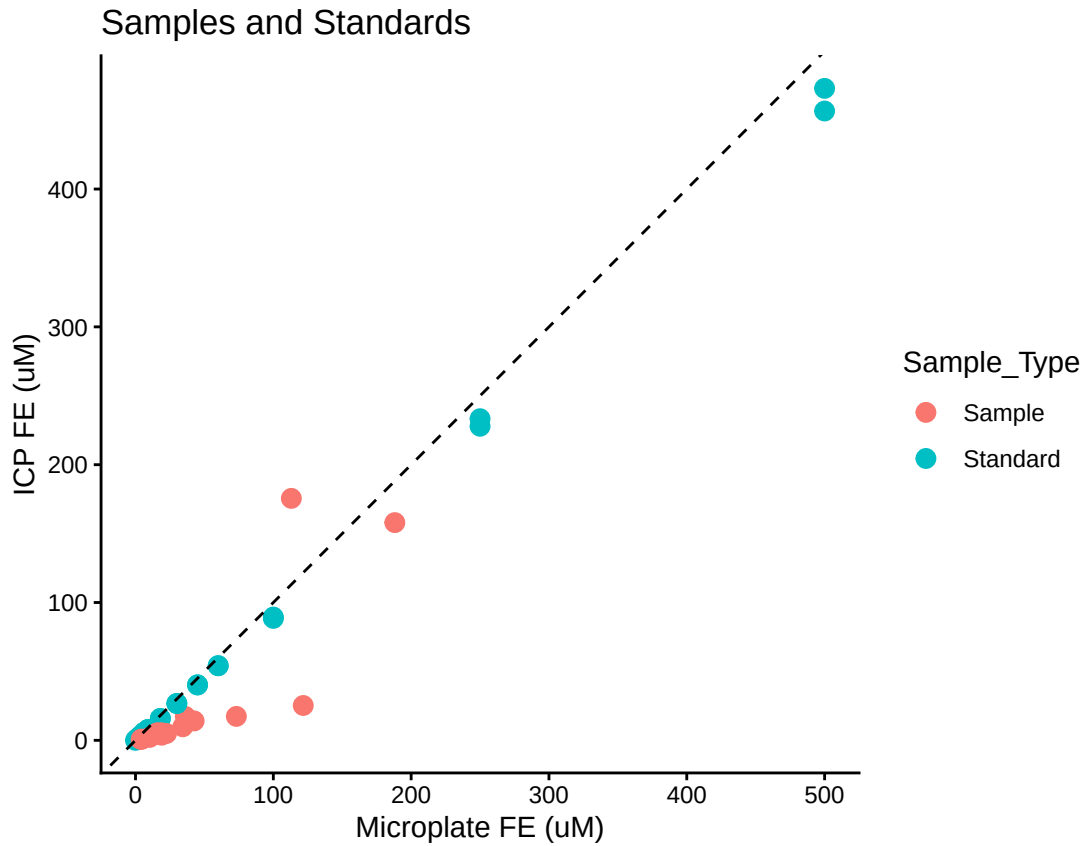

2026-04-13

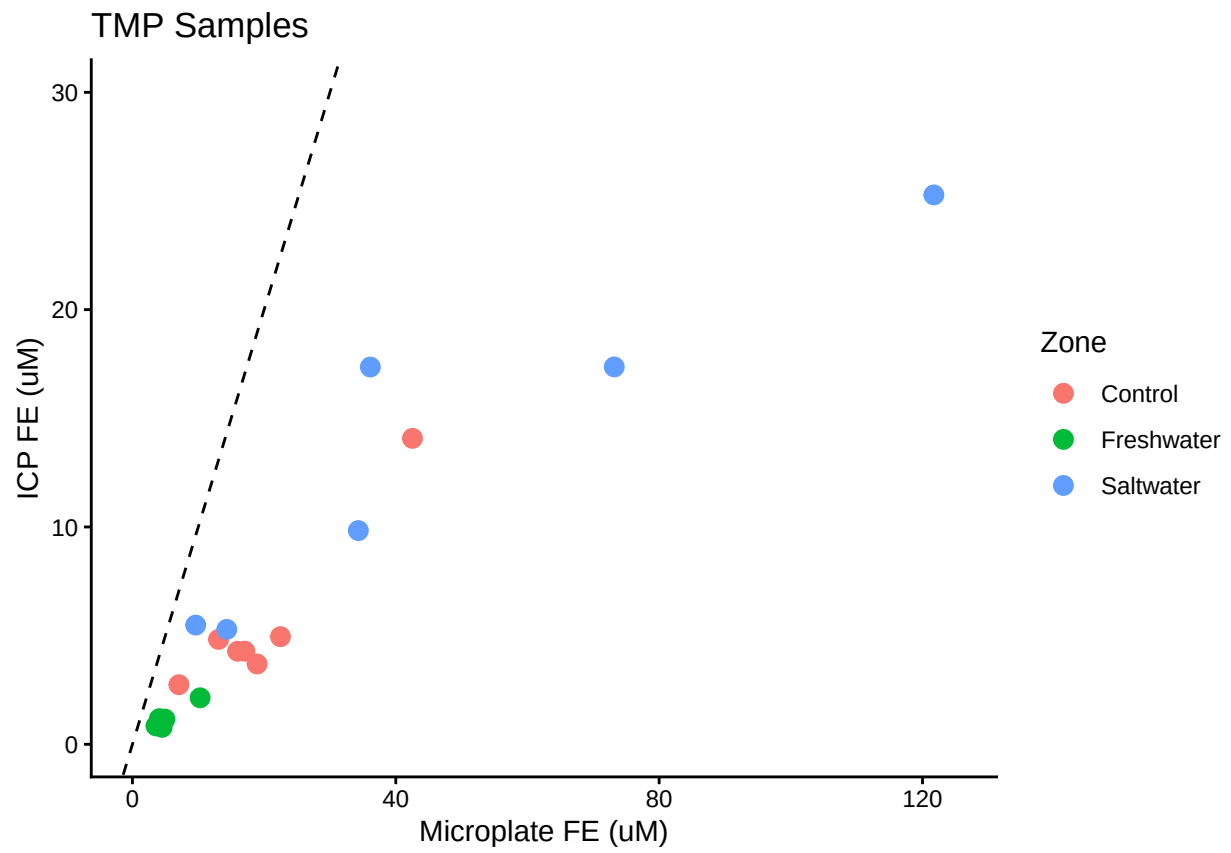

##Collected samples from TEMPEST and GCW TR in March 2026. Some samples were added directly to vials with 75 uL of 50% HCl in the field, some samples were added to empty vials, and then those were acidified in the lab a few weeks later using 75 uL HCl.

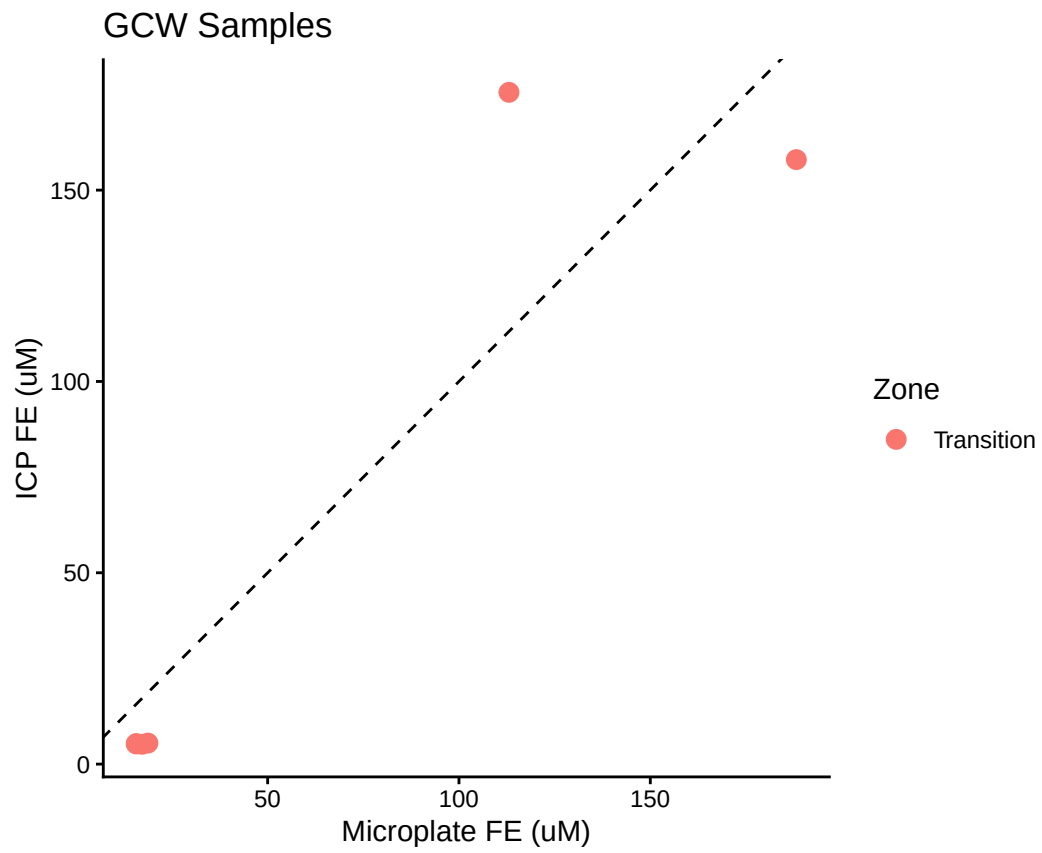

##Samples were ran on the microplate and then on the ICP-OES.

Plotting Microplate vs ICP Total FE values

ICP and Microplate standards appear to align well, although standards are generally lower on the ICP. Samples tended to have much less total iron on the ICP. This is especially true for TMP samples.

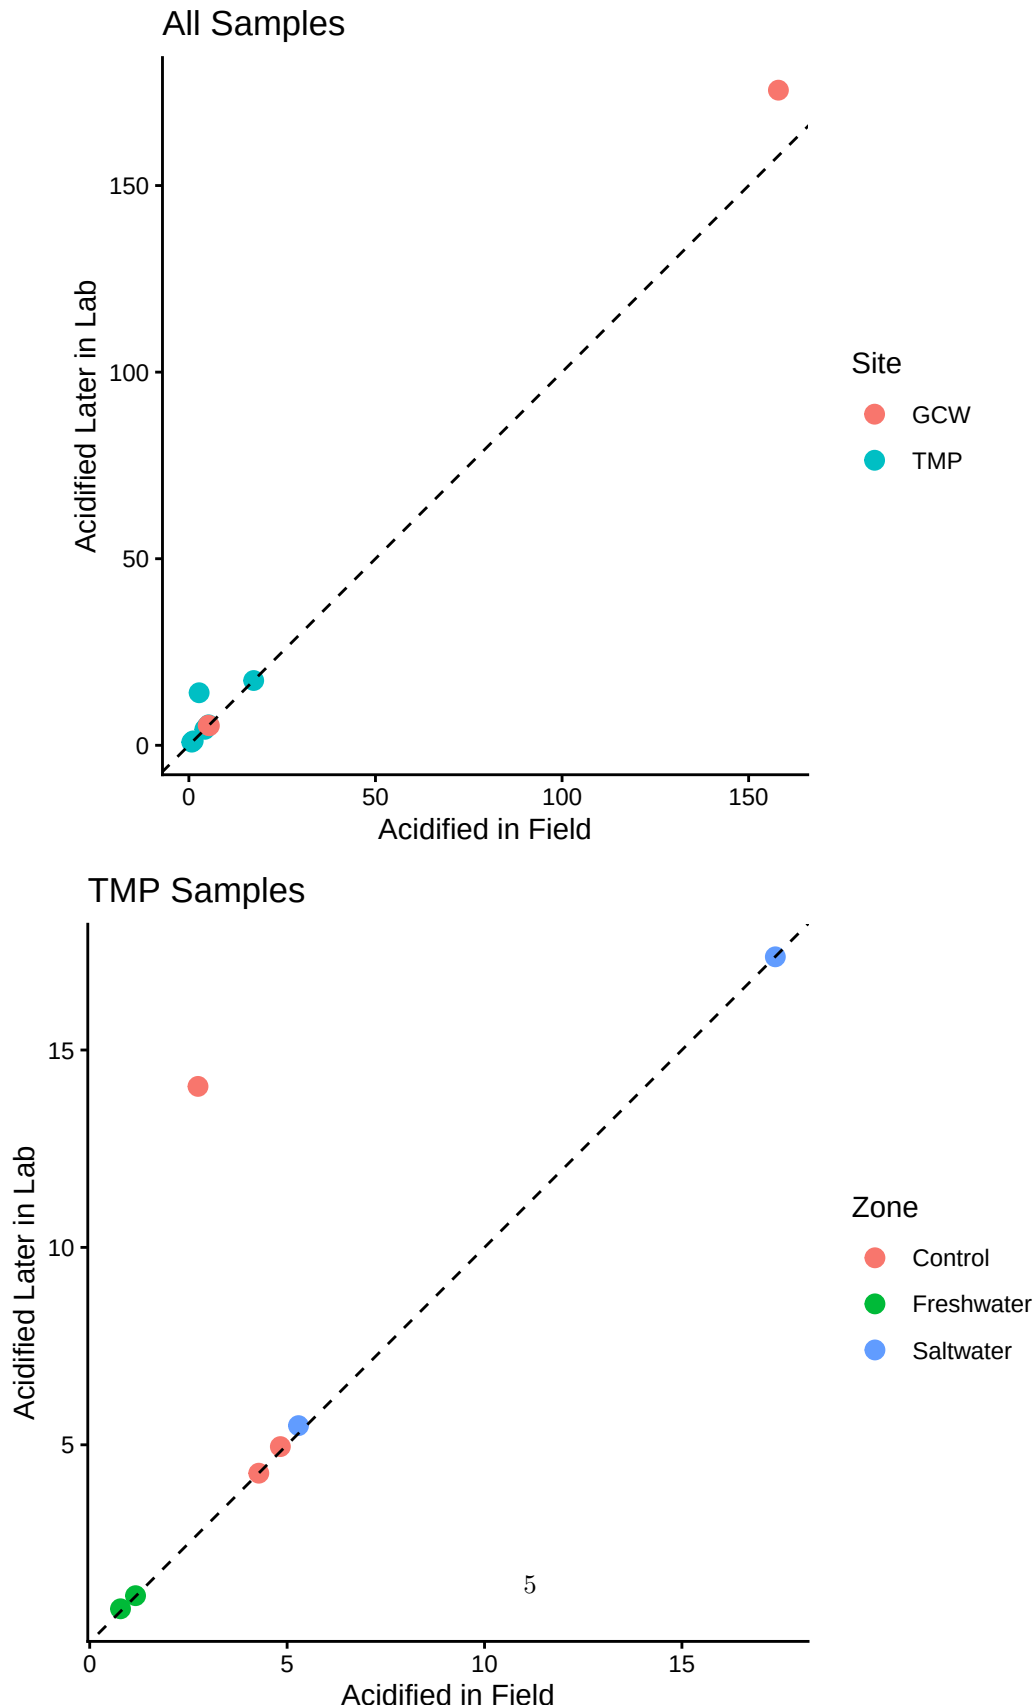

1:1 Plots of Pre-Acidified vs Re-acidified Sample data from ICP

Pre-acidified total iron values seem to match re-acidified values, with re-acidified total iron being slightly higher. There is one outlier sample that has a strong mismatch.

Barplots of Pre-Acidified vs Re-acidified Sample data from ICP
